

AI at Work — Without the Risk

One-page Risk Map (Preview)

ABSTRACT

This is operational guidance for IT teams. Not legal or compliance advice.

1. If you have to ask “Is this safe to paste?” the answer is usually no. Use this map so people don’t have to guess.

- **What it is:** Public knowledge, generic docs, formatting, refactoring, non-sensitive summaries.
 - **Examples:** Ticket summaries with placeholders, KB outlines, regex generation, generic PowerShell scaffolds.
 - **Rule:** No customer data, no internal identifiers, no secrets.
-
- **What it is:** Internal context where details matter but can be redacted.
 - **Examples:** Incident timelines, environment-specific scripts, internal meeting notes.
 - **Rule:** Strip names, usernames, IPs, hostnames, tenant IDs; use placeholders; add a reviewer checkpoint.
-
- **What it is:** Anything that would be damaging in an audit log.
 - **Examples:** Credentials/tokens, PII, patient data, customer lists, network diagrams, proprietary source code with secrets.
 - **Rule:** Don’t paste. Use internal tools/workflows only.

- [] No PII in this prompt.
- [] No credentials or tokens.
- [] All hostnames replaced with placeholders.
- [] I’d be comfortable if this appeared in an audit log.

The full PDF includes 30 safe prompt templates, a rollout checklist, workflow examples, and manager scripts.
